Event Management App

Final Requirements for

Free Elective 3

Sy. 2025-2026

2nd Semester

IT-405

Presented by:

Villeza, Nathaniel P. – (Group Leader)

Dela Cruz, Clyde Isiah – (Member)

Date of presentation: / /2026

CHAPTER I

Project Introduction

The Bataan Event Hub (BEH) is an Android-based Event Management Application designed to simplify and modernize the process of organizing, managing, and monitoring events. Traditional event management often relies on manual coordination, scattered communication, and inefficient tracking of attendees and event resources. These challenges can lead to miscommunication, data inconsistencies, and difficulty in monitoring event progress and participation.

To address these issues, the system was developed to provide a centralized and digital platform where administrators and attendees can interact efficiently. The application focuses on three major components: event creation, RSVP management, and reporting. These components work together to ensure that event information is properly recorded, participants are accurately tracked, and event data is organized for evaluation and documentation purposes.

The system offers a comprehensive set of features that enhance usability and efficiency. Administrators are able to create events by entering complete details such as event title, schedule, venue, organizer, and description. The system also supports budget planning and material tracking, allowing administrators to monitor expenses and remaining budget in real time. Additionally, event images can be attached to improve presentation and user engagement.

For attendee management, the system includes a robust RSVP module. Users can register for events and, if required, upload payment receipts as proof of participation. Each registration is recorded with a reference number, submission date, and status, such as pending, approved, cancelled, or confirmed. Administrators can review attendee records, verify uploaded receipts, and manage participation accordingly. This ensures an organized and controlled registration process.

The system also provides a reporting feature that allows administrators to generate detailed event reports. These reports include event information, materials used, budget and expenses, and attendee statistics such as total participants and payment status. The reports can be exported into document formats such as PDF and Word-compatible files, making them suitable for documentation, presentation, and record-keeping.

In terms of user experience, the application is designed with a clean and user-friendly interface, ensuring ease of navigation for both administrators and attendees. The system implements role-based access, where sensitive data such as financial information and materials are only visible to administrators, while attendees are provided with only the necessary event details. Real-time data synchronization ensures that users always see updated information without requiring manual refresh.

Overall, the Bataan Event Hub provides an efficient, reliable, and organized solution for event management. By replacing manual processes with a structured digital system, it improves accuracy, enhances user interaction, and supports better decision-making for event organizers.

CHAPTER II

DATA COLLECTION

Research Methodology

The study utilized a **hybrid research methodology**, combining both qualitative and quantitative approaches to analyze and improve the event management process. This method was selected to ensure a comprehensive understanding of how traditional event management systems operate and how a digital solution can enhance efficiency and accuracy.

The qualitative approach was applied through observation of common event management practices, such as manual registration of attendees, informal tracking of event details, and the use of non-centralized communication methods. These practices were analyzed to identify common issues, including disorganized data, lack of real-time updates, and difficulty in managing participant records.

On the other hand, the quantitative approach was used to evaluate structured data within the system, such as the number of attendees, event participation status, payment records, and generated reports. These data points are collected and stored within the application to provide measurable insights into event performance and participation.

The developed Bataan Event Hub application gathers data digitally by allowing administrators to input event details, manage attendee registrations, and monitor event-related information in real time. Attendees can register for events, submit payment receipts when required, and receive updates regarding their participation status.

The system interprets the collected data by organizing it into structured records such as attendee lists, payment statuses (pending, paid, cancelled, or joined), and event summaries.

These data are then presented in a user-friendly format through lists, summaries, and report outputs. The reporting feature further processes this information by generating complete event reports that include event details, materials, budget allocation, expenses, and attendee statistics.

The graph shows the event summary generated by the application. It presents the total number of created events, registered attendees, paid participants, and pending attendees. This helps administrators quickly understand the overall performance of events and monitor participant status without manually reviewing individual records.

Research Result: Event Management Flow 1

The figures presented in this section illustrate the flow and core functionalities of the Bataan Event Hub application.

The first set of figures demonstrates the **event creation process**, where administrators can input essential event details such as title, schedule, venue, organizer, and description. The system also allows the inclusion of budget allocation, materials selection, and optional event images. This process ensures that all necessary event information is recorded and organized before publication.

The next set of figures shows the **RSVP and attendee management process**. Users can register for events through the application, and if the event requires payment, they are prompted to upload a receipt. Each registration is recorded with a unique reference number, date, and status. Administrators can review all attendee records, verify uploaded receipts, and update participation status accordingly. This ensures a controlled and validated registration workflow.

The final set of figures presents the **reports system**, where administrators can view summarized and detailed event data. The system displays key information such as total attendees, confirmed participants, payment status, materials used, and financial summaries. Additionally, the system provides options to generate reports in PDF and Word-compatible formats, making it suitable for documentation and presentation purposes.

These results demonstrate that the system successfully integrates event creation, attendee management, and reporting into a single platform, improving organization and accessibility of event data.

Research Discussion: Event Management Guide

The Bataan Event Hub application provides a structured and user-friendly interface that allows both administrators and attendees to interact efficiently with the system.

The process begins with the event creation module, where administrators input all necessary event details. This includes setting the schedule, selecting a venue, assigning an organizer, and providing a description of the event. The system also allows the administrator to define the budget and required materials, with automatic computation of expenses and remaining budget. An optional image attachment enhances the visual representation of the event.

Once the event is created, it becomes available to users through the system interface. Attendees can view event details and proceed with registration through the RSVP module. If payment is required, users are guided to upload a receipt image as proof of payment. The system records the submission along with a reference number, date, and day, ensuring traceability of each registration.

Administrators can access the RSVP records through a dedicated interface where they can view attendee details, verify receipt uploads, and manage participation status. Actions such as approving or cancelling registrations allow administrators to maintain control over event participation.

The system also includes a reports module, which provides a comprehensive overview of event data. Administrators can view detailed reports that include event information, materials, financial data, and attendee statistics. The application also supports exporting reports into PDF and Word-compatible formats, making it useful for documentation and evaluation.

Overall, the system demonstrates an efficient approach to event management by integrating multiple functionalities into a single application. It reduces reliance on manual processes, improves data accuracy, and enhances user experience through a clean and organized interface.
